

## **POLICY OF SUSTAINABILITY**

Environmental protection is a global problem and therefore requires global solutions. It is not possible to protect the environment in preventing economic development, but focus on how to achieve sustainable development. Therefore, in order to support sustainable development, we strive to introduce socially responsible behavior both towards the social community and to the ecological balance, with the aim of providing quality to our guests. The relationship between economic systems and those of ecological character must be in balance. One of the significant contributions to sustainable development is the integration of environmental management systems in accordance with ISO 14001 requirements in the management system. Such a system requires:

- preservation of natural resources,
- introduction and application of new technologies,
- abandoning activities that could endanger the implementation of sustainable development

Environmental protection in the hotels is only possible if all employees work together. We strive to promote awareness of environmental protection with our employees through information and training.

Recycling is a part of the vision with which we want to create a possibility for each employee and guest to separate all kinds of useful waste at the site. With this aim, waste is being sorted as cardboard, glass and degradable waste as a sustainable waste collection system in our hotel. When ordering a product, we also choose products in larger packages, thus reducing the amount of waste produced during use. Among other things, we aim to reduce the consumption of CO<sub>2</sub> and resources such as electrical energy, water and heating with the ultimate goal of more rational use of resources, whereby renewable sources are ultimately a priority in relation to limited resources.
